- $\dfrac{\text{C=分析特徵的蛋白質個數}}{\text{D = 母群體的蛋白質個數}}$ $\dfrac{\text{A=B∩C}}{\text{B = 使用者輸入的蛋白質個數}}$

- $\dfrac{C= 49}{D = 6705}$ $\dfrac{B∩C = 8}{B = 500}$

```python
import scipy.stats
```

```python
def fisher(A,B,C,D) :

    T = int(A)      #交集數          1      剩下的交集處
    S = int(B)      #輸入 genes數    18     輸入一總數
    G = int(C)      #genes 樣本數    1117    篩選的樣本
    F = int(D)      #總 genes數      6572   輸入二總數

    S_T = S-T
    G_T = G-T
    F_G_S_T = F-G-S+T

    oddsratio, pvalue_greater = scipy.stats.fisher_exact( [ [T,G_T] , [S_T,F_G_S_T]] ,'greater')
    oddsratio, pvalue_less = scipy.stats.fisher_exact( [ [T,G_T] , [S_T,F_G_S_T]] ,'less')

    return pvalue_greater
```

校正p-value

https://www.statsmodels.org/dev/generated/statsmodels.stats.multitest.multipletests.html

```
from statsmodels.stats.multitest import multipletests
```

```
cut_off = 0.01
P_value_corr_FDR = multipletests(test,alpha=cut_off, method= "fdr_bh")
P_value_corr_Bon = multipletests(test,alpha=cut_off, method= "bonferroni")
```

P-value list
Ex:[0.057, 0.08, 0.13, 0.9……]

校正方法

`P_value_corr_FDR` 出來後的結果如下

```
[ [小於cut off 回傳True], [校正後的P-value], [corrected alpha for Sidak method], [corrected alpha for Bonferroni method] ]
```
